MECHANICAL NOTES:

1. Outdoor air. Where the space in which fuel-burning appliances are located does not meet the criterion for indoor air specified in section M1702, outside combustion air shall be supplied in section M1703.2.

2. Two openings or ducts. Outside combustion air shall be supplied through openings or ducts. One opening shall be within 12 inches of the top of the enclosure. and one within 12 inches of the bottom of the enclosure. Openings are permitted to connect to spaces directly communicating with the outdoors, such as ventilated crawl spaces or ventilated attic spaces. The same duct or opening shall not serve both combustion air openings. The duct serving the upper opening shall be level or extend upward from the appliance space.

3. Size of Openings. Where directly communicating with the outdoors, or where communicating with the outdoors by means of vertical ducts, each opening shall have a free area of at least 1 square inch per 4,000 BTU/Per hour of total input rating of all appliances in the space. Where horizontal ducts are used, each opening shall have a free area of at least 1 square inch per 2,000 BTU/Per hour of total input of all appliances in the space. Ducts shall be of the same minimum cross-sectional area as the required free area of the openings to which they connect. The minimum cross-sectional dimension of rectangular air ducts shall be 3 inches.

4. The attic ventilation shall be sufficient to provide the required volume of combustion air.

5. The combustion air opening in the attic shall be provided with a metal sleeve extending from the appliance enclosure to at least 6 inches above the top of the ceiling joists and ceiling insulation.

6. An inlet air duct within an outlet air duct shall be an acceptable means of supplying attic combustion air to an appliance room provided that the inlet duct extends at least 12 inches above the top of the outlet duct in the attic space.

7. The end of ducts that terminate in an attic shall not be screened.

8. Under-floor combustion air. Combustion air obtained from under-floor areas, shall have free opening areas to the outside equivalent to not less than twice the required combustion air opening.

9. Opening requirements. Outside combustion air openings shall be covered with corrosion-resistant screen or equivalent protection having not less than 1/4-inch openings.

10. Duct penetration. Ducts in the garage and ducts penetrating the walls or ceilings separating the dwelling from the garage shall be constructed of a minimum No. 26 gauge sheet steel or other approved material and shall have no openings into the garage.

11. Other penetrations. NO Penetrations or Openings through the specified 2-HR Fire Separation Wall, Shaftliners, OR Party Walls Shall be Allowed.

12. In buildings of unusually tight construction, combustion air shall be obtained from outside the sealed thermal envelope. In buildings of ordinary tightness, insofar as infiltration is concerned, all or a portion of the combustion air for fuel-burning appliances may be obtained from infiltration when the room or space has a volume of 50 cubic feet per 1,000 btu/h (4.83 l/w) input.

13. Where the space is of adequate volume in accordance with section m1702.1 or section m1702.2, but is within a building sealed so tightly that infiltration air is not adequate for combustion, combustion air shall be obtained from outdoors or from spaces freely communicating with the outdoors in accordance with section m1703.
